Production Performance Package

For "hands free" system operation

The TAK "Production Performance Package" consists of an ergonomically positioned controller, status indicator light pole with sound element, and a series of sensors to detect various conditions and shut the system down automatically. The system will shut down if the preset quantity count is reached, the system runs out of wire, a "snag" signal is received from the payoff unit, the air volume falls below optimum operating level, an integrated ancillary component fails to function, or any other remote down stream customer device provides a signal/

Pro-Pack is available on any TAK series feed and cutoff system to run completely independent of constant operator monitoring. Any detected problem immediately shuts the system down. Due to the quick response of the sensors many problems can be quickly addressed without having to "re-thread" the machine or other time consuming operations.

- Status Light Pole w/ Audible Signal
- Material Feed Snag Sensor I/O
- Low Air Pressure Sensor
- Part on Command I/O
- Preset Count Shutdown
- Remote Start / Stop I/O
- Master / Slave I/O
- Wire out Sensor
